Plotting
```

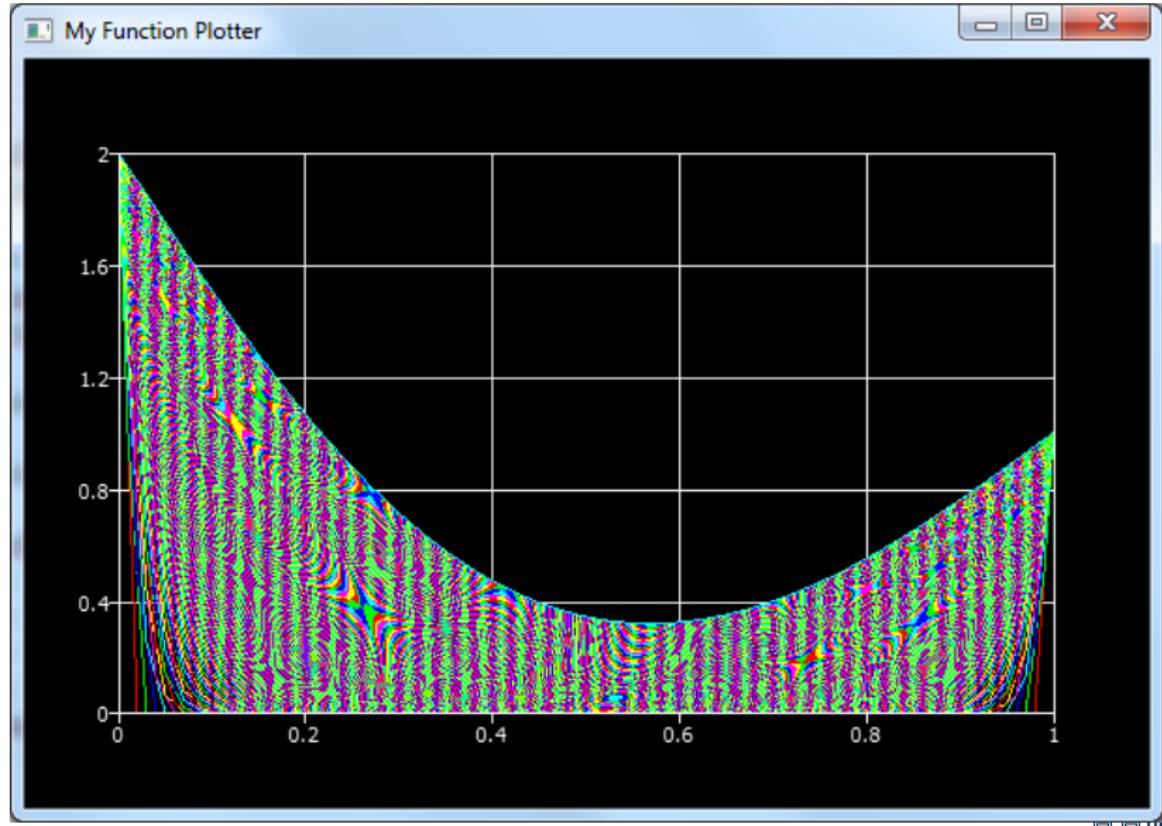

- ▶ Qt Installation (C++ Compiler und Konsole)
- ▶ Python Installation (weiter Pakete laden, `matplotlib`)

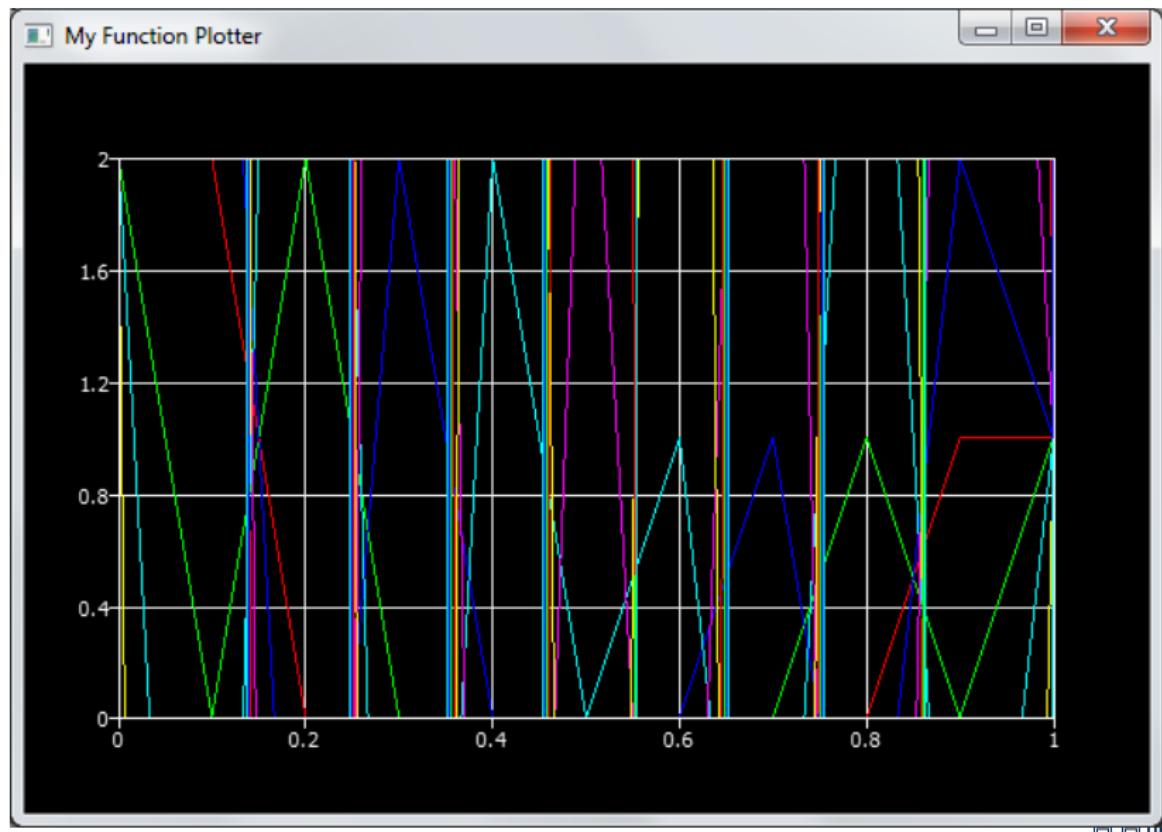

BHYWI-08-09HW2

- ▶ Namen/Matrikelnummer in den Plot eintragen
- ▶ Nur jede 10. Kurve plotten

Letzte Vorlesung: explizite FDM mit Qt

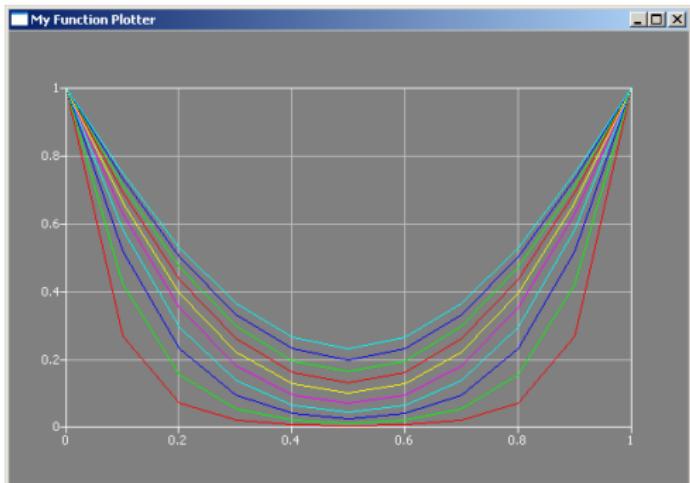

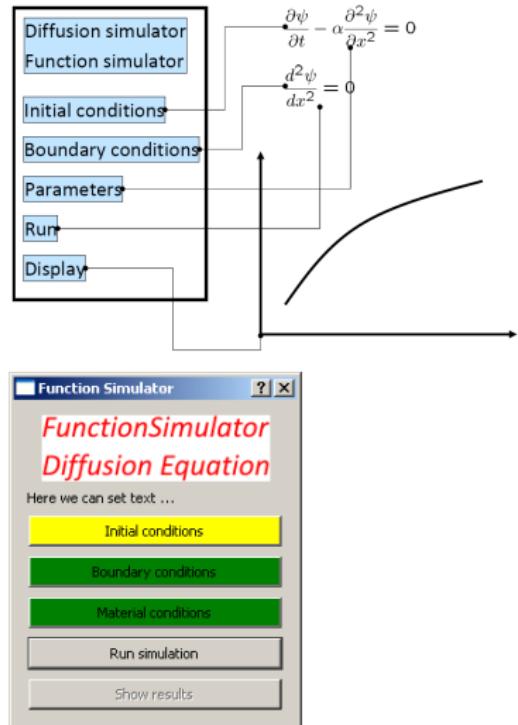

Letzte Vorlesung: explizite FDM - Zeitschrittbegrenzung

$$Ne = \alpha \frac{\Delta t}{\Delta x^2} \leq 0.5 \quad (1)$$

Ziel der Vorlesung

Implicit FDM - Theory #1 (Skript 4.2)

- ▶ PDE for diffusion processes

$$\frac{\partial u}{\partial t} - \alpha \frac{\partial^2 u}{\partial x^2} = 0 \quad (2)$$

- ▶ Time discretization

$$\left[\frac{\partial u}{\partial t} \right]_j^n \approx \frac{u_j^{n+1} - u_j^n}{\Delta t} \quad (3)$$

- ▶ Forward time / centered space

$$\left[\frac{\partial^2 u}{\partial x^2} \right]_j^{n+1} \approx \frac{u_{j-1}^{n+1} - 2u_j^{n+1} + u_{j+1}^{n+1}}{\Delta x^2} \quad (4)$$

- ▶ (Current time / centered space)

$$\left[\frac{\partial^2 u}{\partial x^2} \right]_j^n \approx \frac{u_{j-1}^n - 2u_j^n + u_{j+1}^n}{\Delta x^2} \quad (5)$$

Implicit FDM - Theory #2 (Skript 4.2)

- ▶ Substitute into PDE

$$\frac{u_j^{n+1} - u_j^n}{\Delta t} - \alpha \frac{u_{j-1}^{n+1} - 2u_j^{n+1} + u_{j+1}^{n+1}}{\Delta x^2} = 0 \quad (6)$$

- ▶ Algebraic equation (index notation)

$$\frac{\alpha \Delta t}{\Delta x^2} (-u_{j-1}^{n+1} + 2u_j^{n+1} - u_{j+1}^{n+1}) + u_j^{n+1} = u_j^n \quad (7)$$

- ▶ Algebraic equation (matrix notation)

$$\mathbf{Ax} = \mathbf{b} \quad (8)$$

- ▶ Explain steps with black board

Implicit FDM - Theory #3 (Skript 4.2)

- ▶ Algebraic equation (matrix notation)

$$\mathbf{Ax} = \mathbf{b} \quad (9)$$

- ▶ Algebraic equation (index notation)

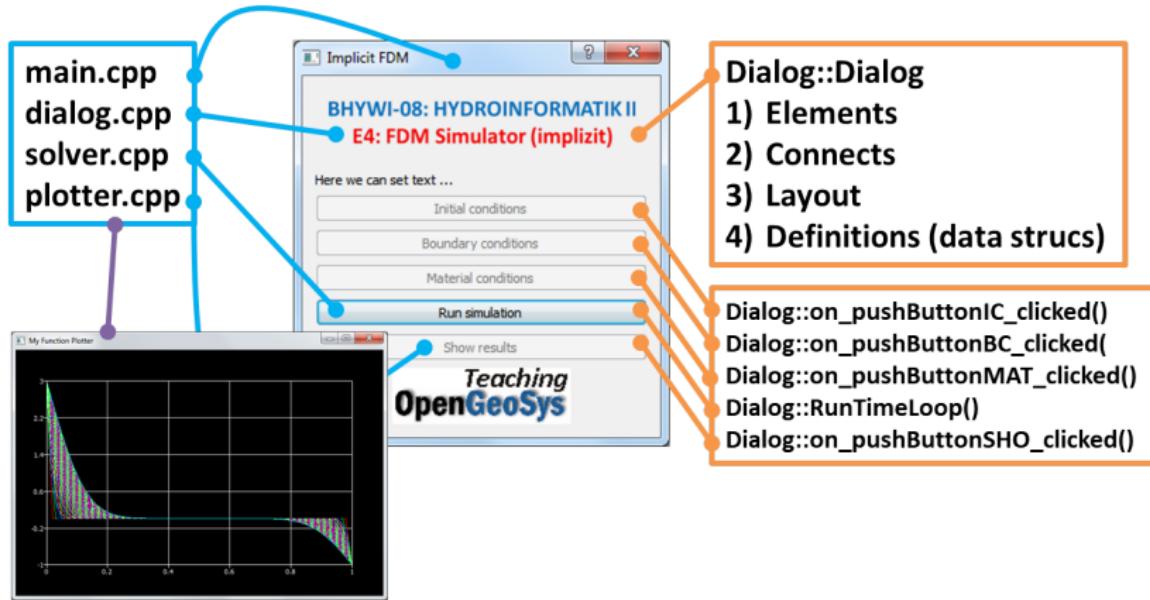

$$Ne (-u_{j-1}^{n+1} + 2u_j^{n+1} - u_{j+1}^{n+1}) + u_j^n = b_j \quad (10)$$

- ▶ Let's take a closer look ...

$$\underbrace{\begin{bmatrix} 1 + 2Ne & -Ne & & & \\ -Ne & \dots & \dots & & \\ & \dots & \dots & \dots & \\ & \dots & \dots & -Ne & \\ & -Ne & 1 + 2Ne & & \end{bmatrix}}_A \underbrace{\begin{bmatrix} u_0 \\ u_1 \\ \vdots \\ u_{n-1} \\ u_n \end{bmatrix}}_x = \underbrace{\begin{bmatrix} b_0 \\ b_1 \\ \vdots \\ b_{n-1} \\ b_n \end{bmatrix}}_b \quad (11)$$

Qt Version

Qt in a nutshell

Implementation #1

► Data structures (as usual ...)

```
Dialog::Dialog(QWidget *parent) : QDialog(parent)
{
    matrix = new double[n*n];
    vecb = new double[n];
    vecx = new double[n];
}

Dialog::~Dialog()
{
    delete [] matrix;
    delete [] vecb;
    delete [] vecx;
}
```

Implementation #2

► Functions (a pain in the neck ...)

```
AssembleEquationSystem();
Gauss(matrix,vecb,vecx,n);

void Dialog::AssembleEquationSystem()
{...
    int i,j;
    // Matrix entries
    for(i=0;i<n;i++)
    {
        vecb[i] = u_old[i]; // RHS Vektor
        for(j=0;j<n;j++)
        {
            matrix[i*n+j] = 0.0;
            if(i==j) // Hauptdiagonale
                matrix[i*n+j] = 1. + 2.*Ne;
            else if(abs((i-j))==1) // Nebendiagonalen
                matrix[i*n+j] = - Ne;
        }
    }
    ...
}
```

Implementation #3

- ▶ Boundary conditions - concept

$$\mathbf{A}\mathbf{x} = \mathbf{b} \quad (12)$$

$$[1 \ 0 \ 0 \ \dots \ 0] \begin{bmatrix} u_0 \\ u_1 \\ \dots \\ u_n \end{bmatrix} = \begin{bmatrix} u_0 \\ 0 \\ \dots \\ 0 \end{bmatrix} \quad (13)$$

Implementation #4

► Boundary conditions - implementation

```
void Dialog::AssembleEquationSystem()
{
    // Treat boundary conditions
    for(i=0;i<n;i++)
        for(j=0;j<n;j++)
    {
        if(i==0||i==n-1)
            matrix[i*n+j] = 0.0;
    }
    for(i=0;i<n;i++)
    {
        if(i!=0&&i!=n-1)
            continue;
        for(j=0;j<n;j++)
        {
            if(i==j)
                matrix[i*n+j] = 1.0;
            else
                matrix[i*n+j] = 0.0;
        }
    }
}
```

Solving EQS - How to ... the magic Gauss function

► 1

$$a_{11}u_1 + a_{12}u_2 = b_1 \quad (14)$$

$$a_{21}u_1 + a_{22}u_2 = b_2 \quad (15)$$

► 2

$$a_{21}\frac{a_{11}}{a_{21}}u_1 + a_{22}\frac{a_{11}}{a_{21}}u_2 = \frac{a_{11}}{a_{21}}b_2 \quad (16)$$

► 3

$$\left(\frac{a_{22}a_{11}}{a_{21}} - a_{12} \right) u_2 = \frac{a_{11}}{a_{21}}b_2 - b_1 \quad (17)$$

► 4

$$u_2 = \frac{\frac{a_{11}}{a_{21}}b_2 - b_1}{\frac{a_{22}a_{11}}{a_{21}} - a_{12}} \quad (18)$$

Implementation #5

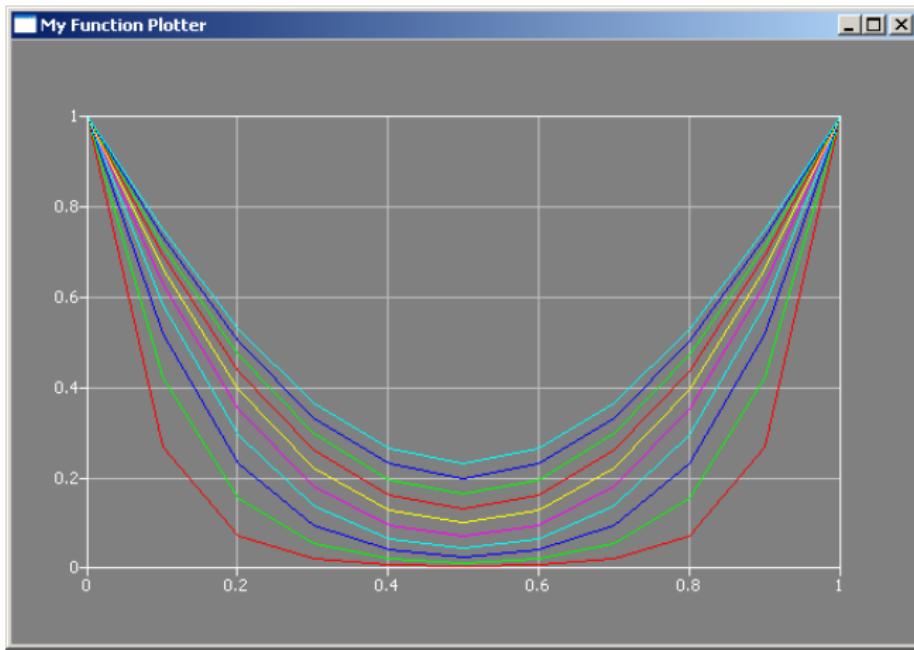

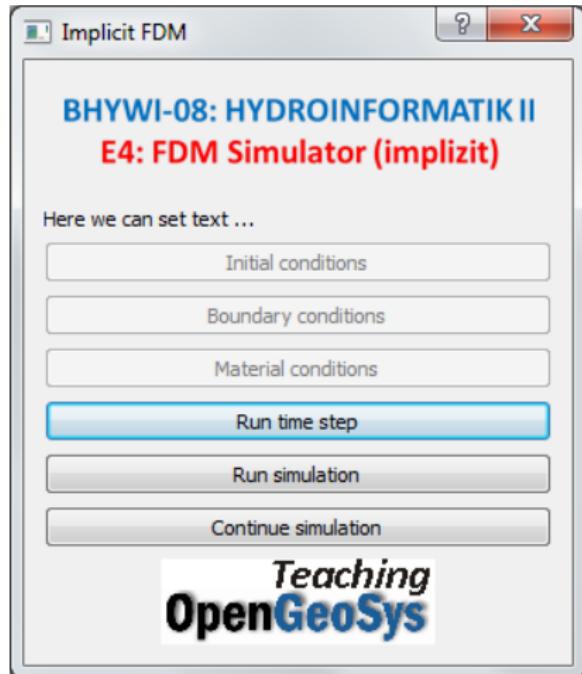

Figure: Zeitliche Entwicklung des Diffusionsprofils - implizites Verfahren
(Wahoo...)

Implementation #6: Run multiple time steps

- Einzelne Zeitschritte
- Mehrere Zeitschritte
- Weiterführen der Berechnung

```
void RunTimeStep();  
void RunTimeLoop();  
void ContinueTimeLoop();
```

C++Basics (Star Wars ...)

- ▶ ... just a star (*)

```
void Dialog::on_pushButtonSH0_clicked()
{
    Plotter *plotter = new Plotter;
    ...
    plotter->show();
}
```

- ▶ ... for better plotting (in your life)

```
void Dialog::SHOBetter()
{
    ...
    plotterAIO->show();
}
```

C++Basics (... the difference (the whole story))

- ▶ Plotter declaration

```
class Dialog : public QDialog  
{...  
private:  
    Plotter *plotterAIO;  
}
```

- ▶ Plotter declaration ... otherwise

```
Dialog::Dialog(QWidget *parent) : QDialog(parent)  
{...  
    plotterAIO = new Plotter;  
}
```

- ▶ Finally ready to use ...

```
void Dialog::SHOBetter()  
{...  
    plotterAIO->show();  
}
```

Python Version
