

# Modeling landscape-related conflicts of renewable energy in Switzerland

- **Felix Kienast**, Marcel Hunziker, Boris Salak, Anna Hersperger, Swiss Federal Institute for Forest, Snow and Landscape Research WSL, Birmensdorf, Switzerland
- Thomas Egli, Ulrike Wissen, Reto Spielhofer, Nica Huber, Victor Schinazi, Tyler Thrash, Adrienne Grêt-Regamey, ETH Zurich, Switzerland

# Perceptions and meanings...

# Perceptions and meanings...

# Topics covered

- Anticipating spatial land-use conflicts
- Using optimization software to pre-select sites with highest energy output at lowest environmental costs
- Improving the fit of renewable energy projects with virtual visual-acoustic simulations (running project)

# Anticipating conflicts using the EGS paradigm

## Energy types

Wind

Solar (roofs)

Solar  
(open field)

Biomass (standing  
wood)

Hydropower

## Ecosystem services

Aesthetics

Cultural heritage

Tourism/recreation

Water cycle

Drinking water

Habitat for species

Conflict matrix

after Kienast et al., 2017

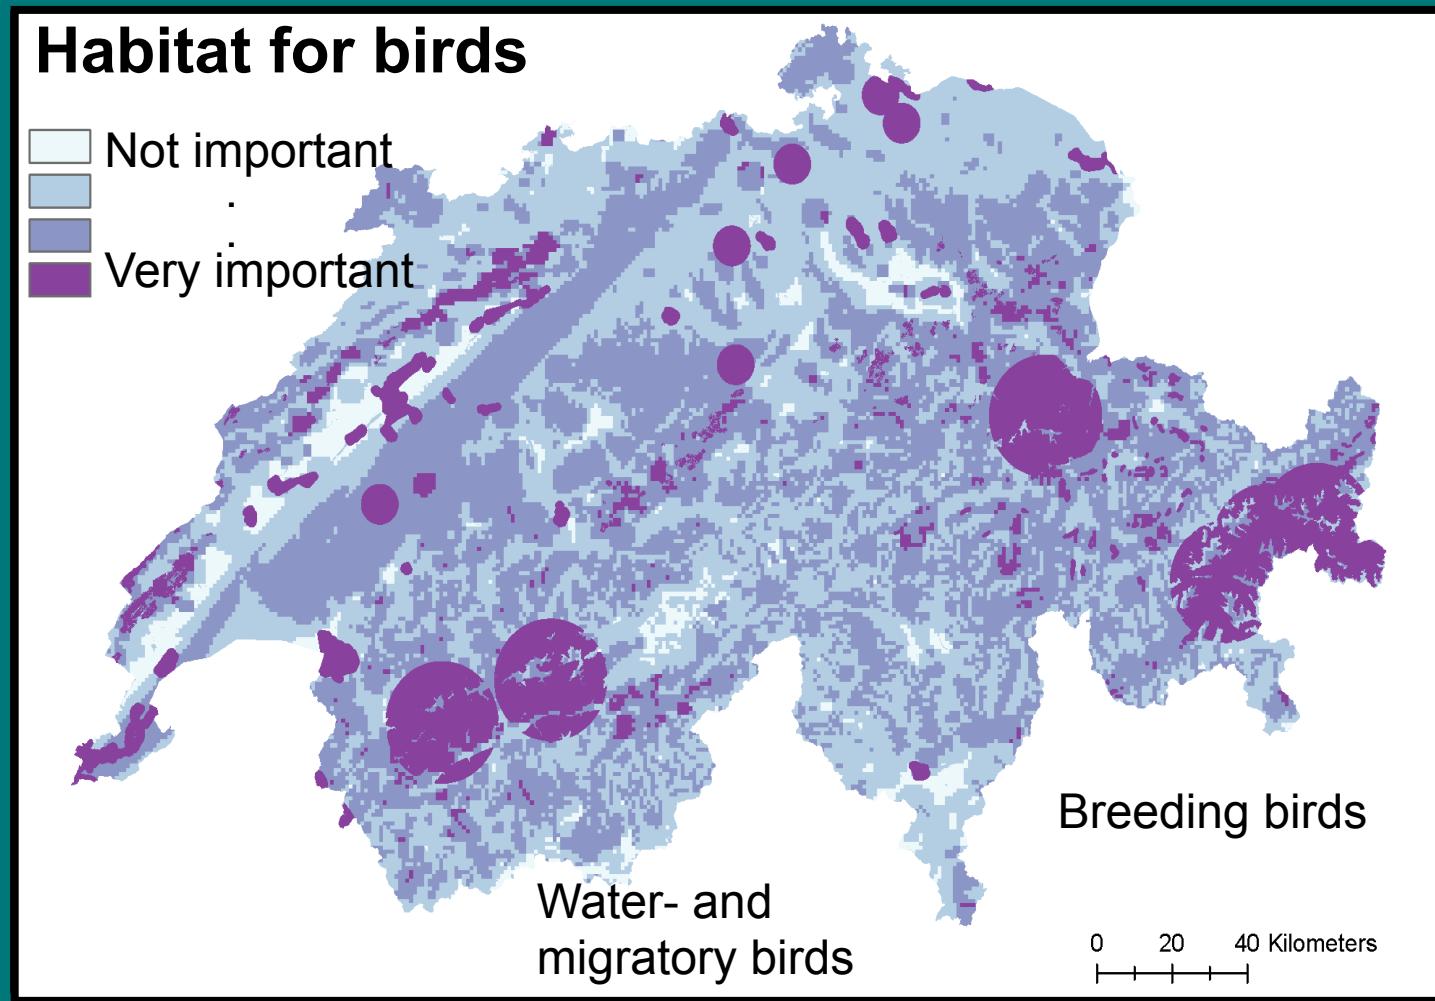

# Legal constraints

- Physical
- National inventories (binding)
- National inventories (negotiable)
- Distance to settlement
- Accessibility
- Military use
- Cantonal protection
- Sites in forests excluded

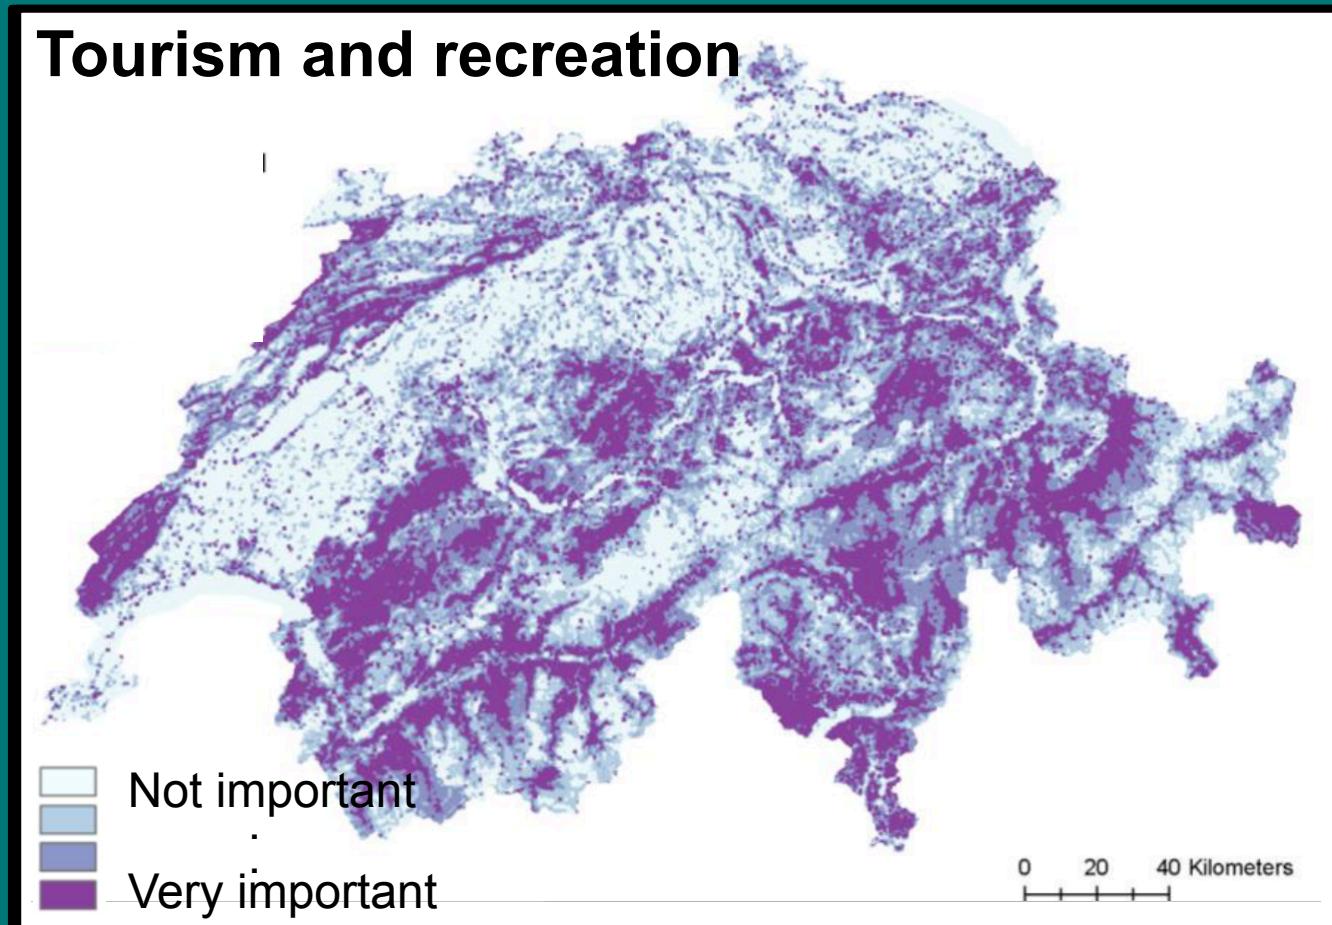

after Kienast et al., 2017

# Service map “Habitat protection”

after Kienast et al., 2017

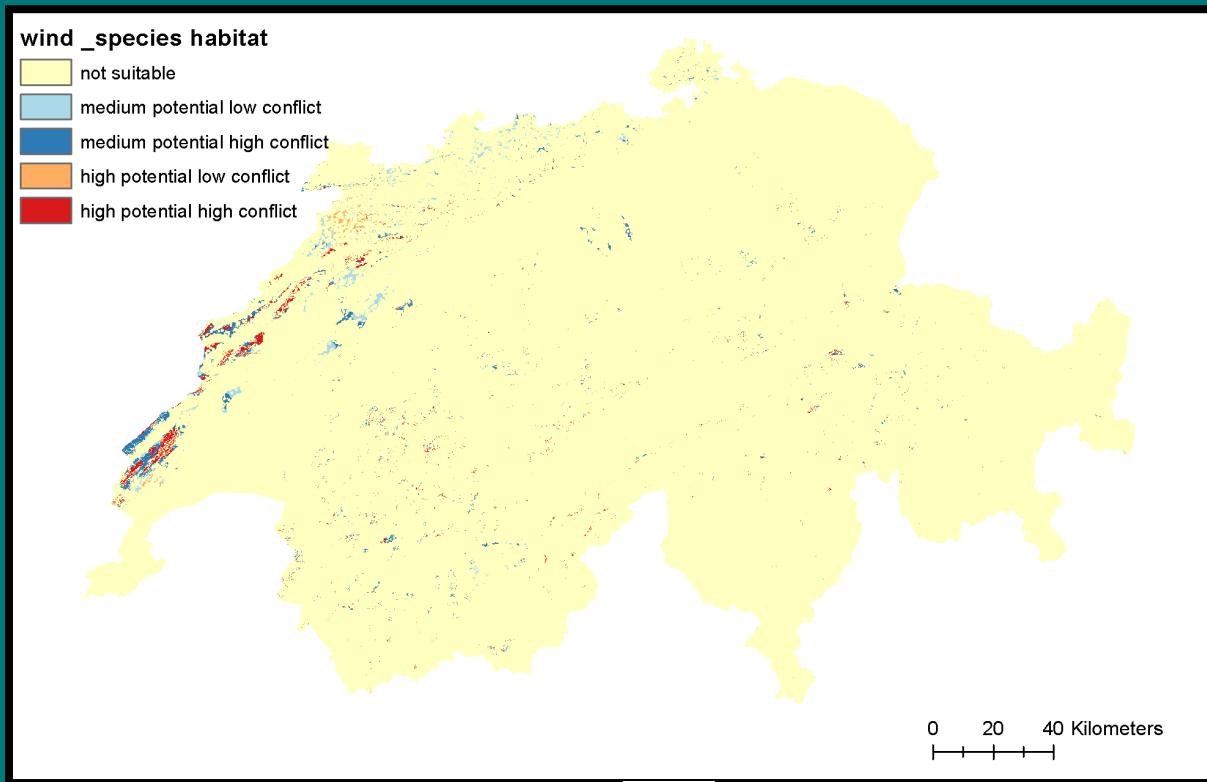

# Service map “Physical and experiential interaction”

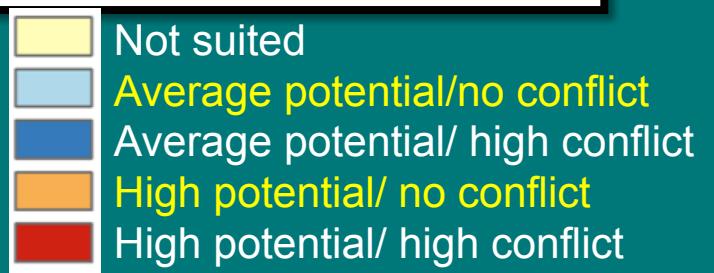

after Kienast et al., 2017

# Conflict maps wind

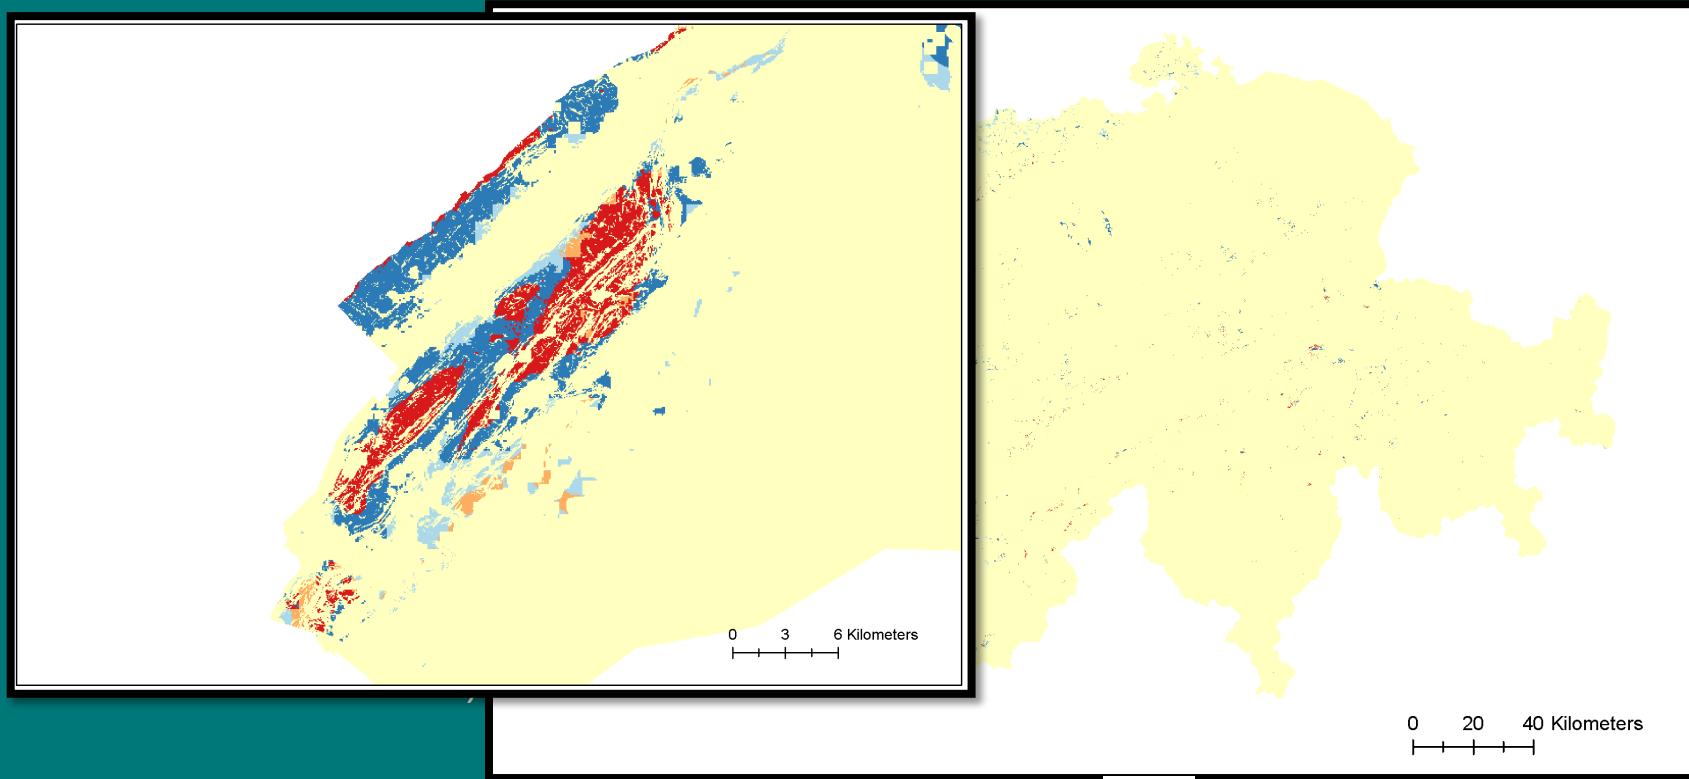

(e.g. wind with  
habitats for birds)

after Kienast et al., 2017

# Conflict maps wind

after Kienast et al., 2017

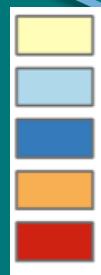

- Not suited
- Average potential/no conflict
- Average potential/ high conflict
- High potential/ no conflict
- High potential/ high conflict

# “Low-conflict” energy ~ phasing out of nuclear (25TWh/year)

	TWh/year
◆ Solar roof:	+ 7.5 <sub>+new urban areas</sub>
◆ Solar open land:	(+ 18) → + 1
◆ Solar openland on “trash land”	+ 8
◆ Wind:	+ 5.1
◆ Wood biomass	+ 3.5-5.3
◆ Water power:	+ 3 (currently 36)
◆ Geothermal, waste disposal	+ ?

after Kienast et al., 2017

# Optimizing site selections

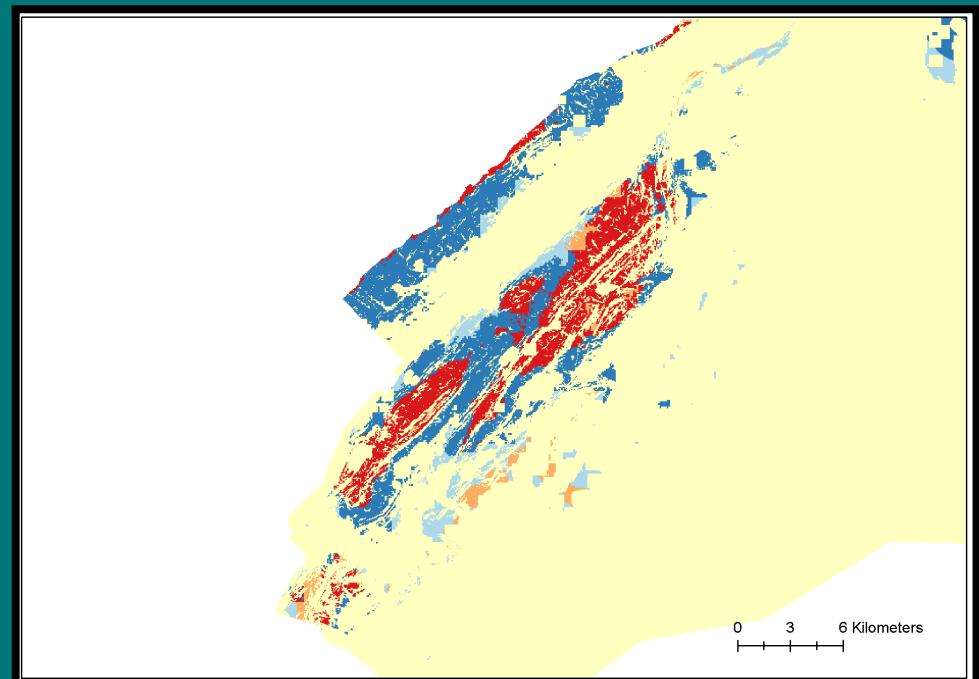

Not suited  
Average potential/no conflict  
Average potential/ high conflict  
High potential/ no conflict  
High potential/ high conflict

**MARXAN**

Energy gain

Cost (EGS)

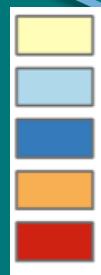

after Kienast et al., 2017

after Egli et al., 2017

# Optimizing site selections

Not suited  
Average potential/no conflict  
Average potential/ high conflict  
High potential/ no conflict  
High potential/ high conflict

## MARXAN

Energy gain

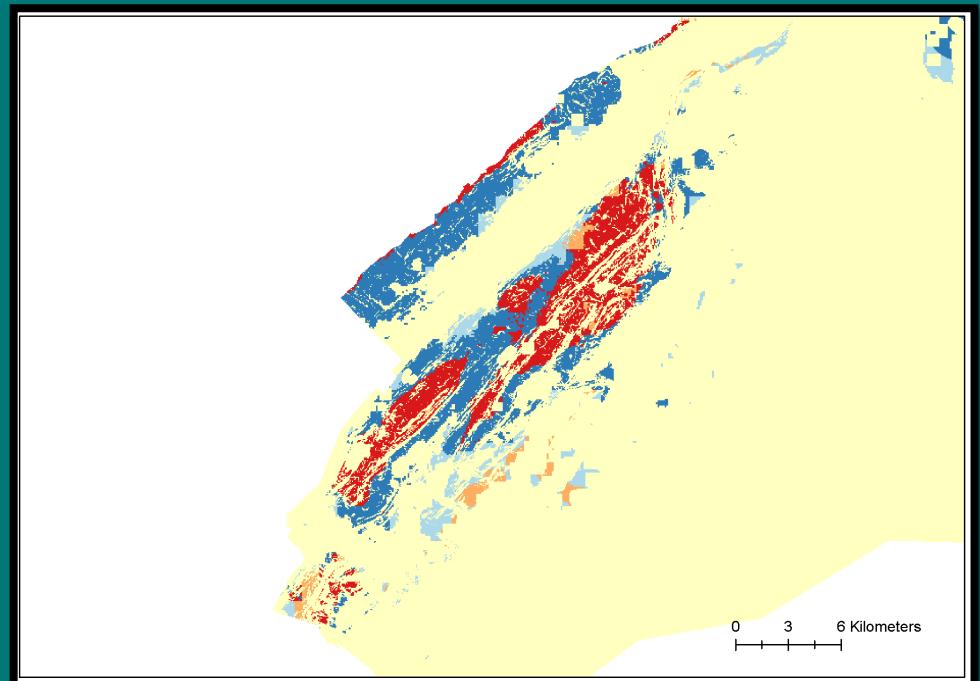

Cost (EGS)

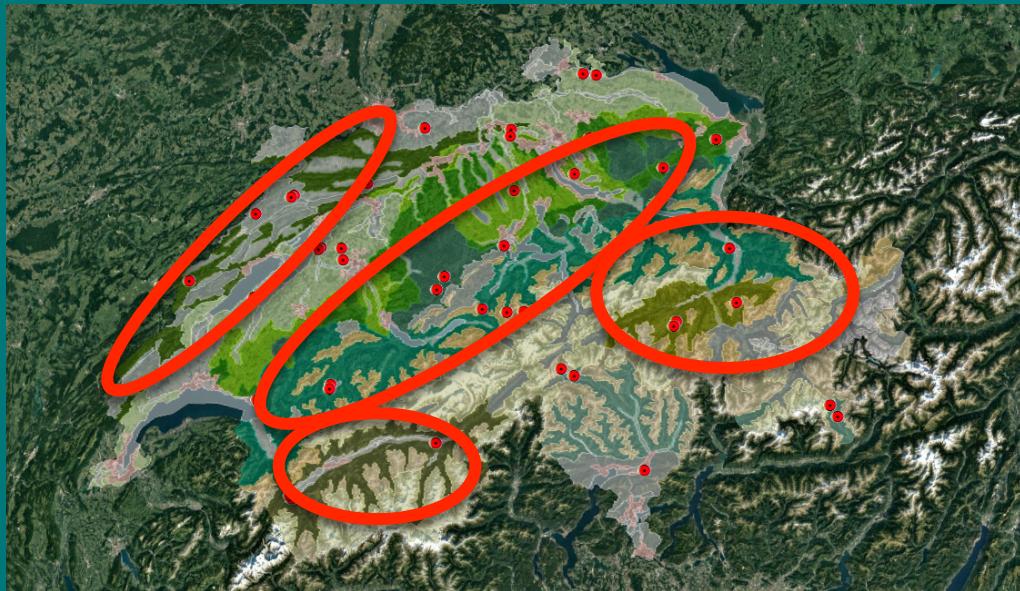

Iterative search for sites with highest gains at lowest cost

- Indispensable sites
- Less sites and a better solution → 13.5% less sites
- difficult to explain to NGOs and policy makers

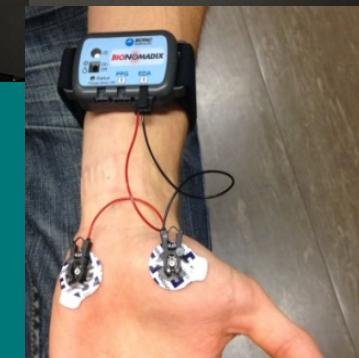

after Kienast et al., 2017

# Improving the fit of renewable energy projects

Expected „energy horse“ areas

Source: ENERGYSCAPE project:  
<https://www.wsl.ch/de/projekte/energyscape.html>

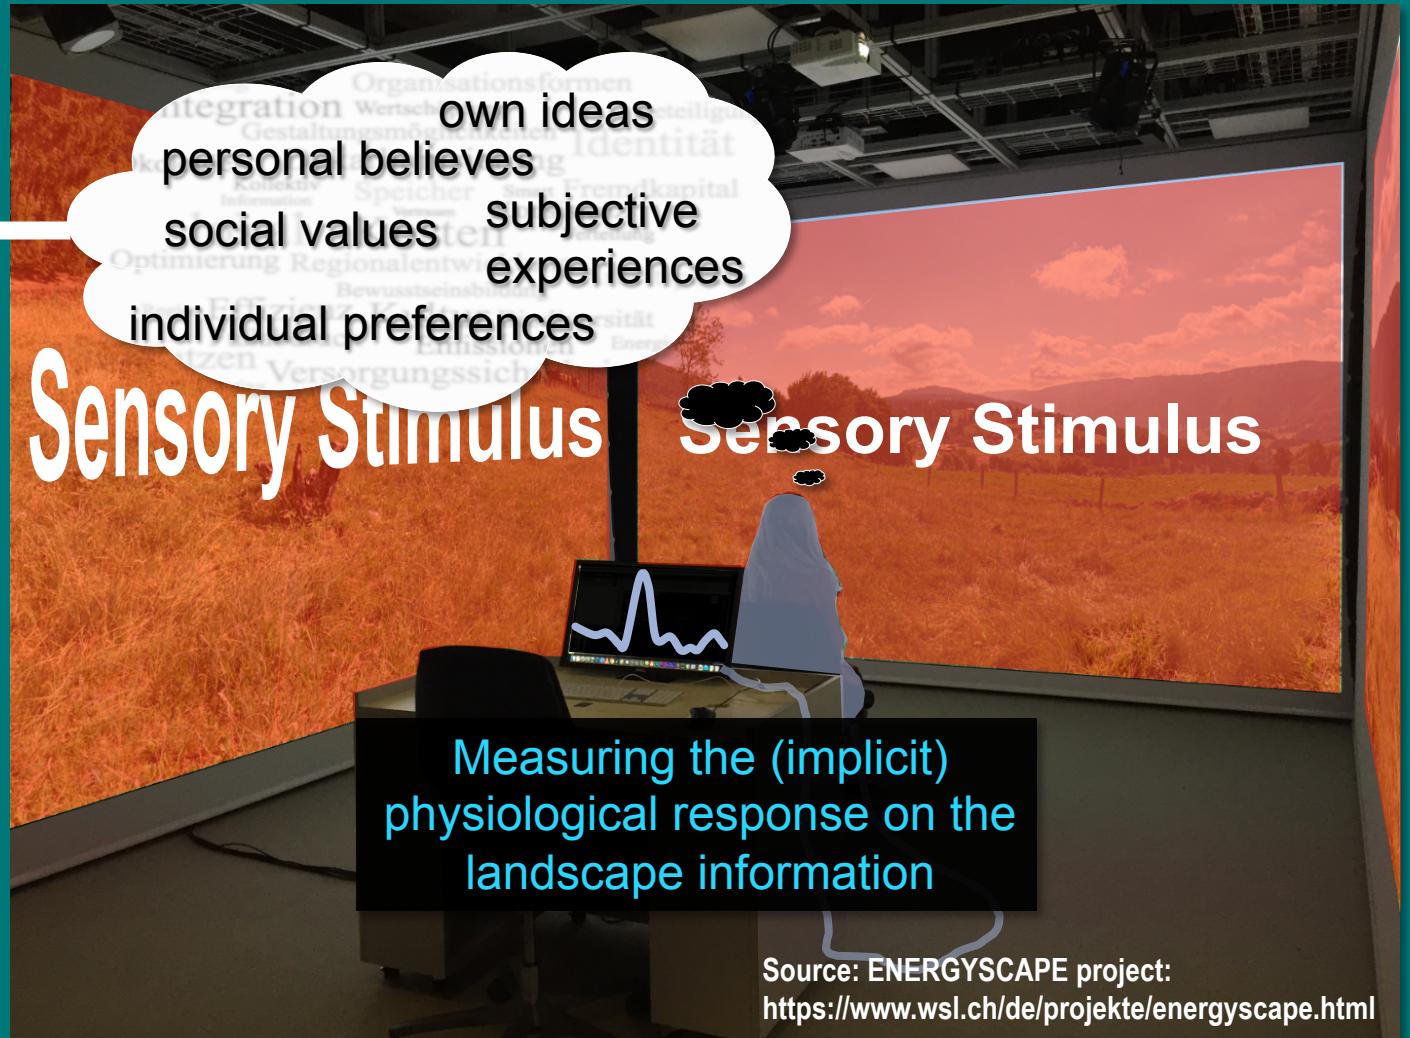

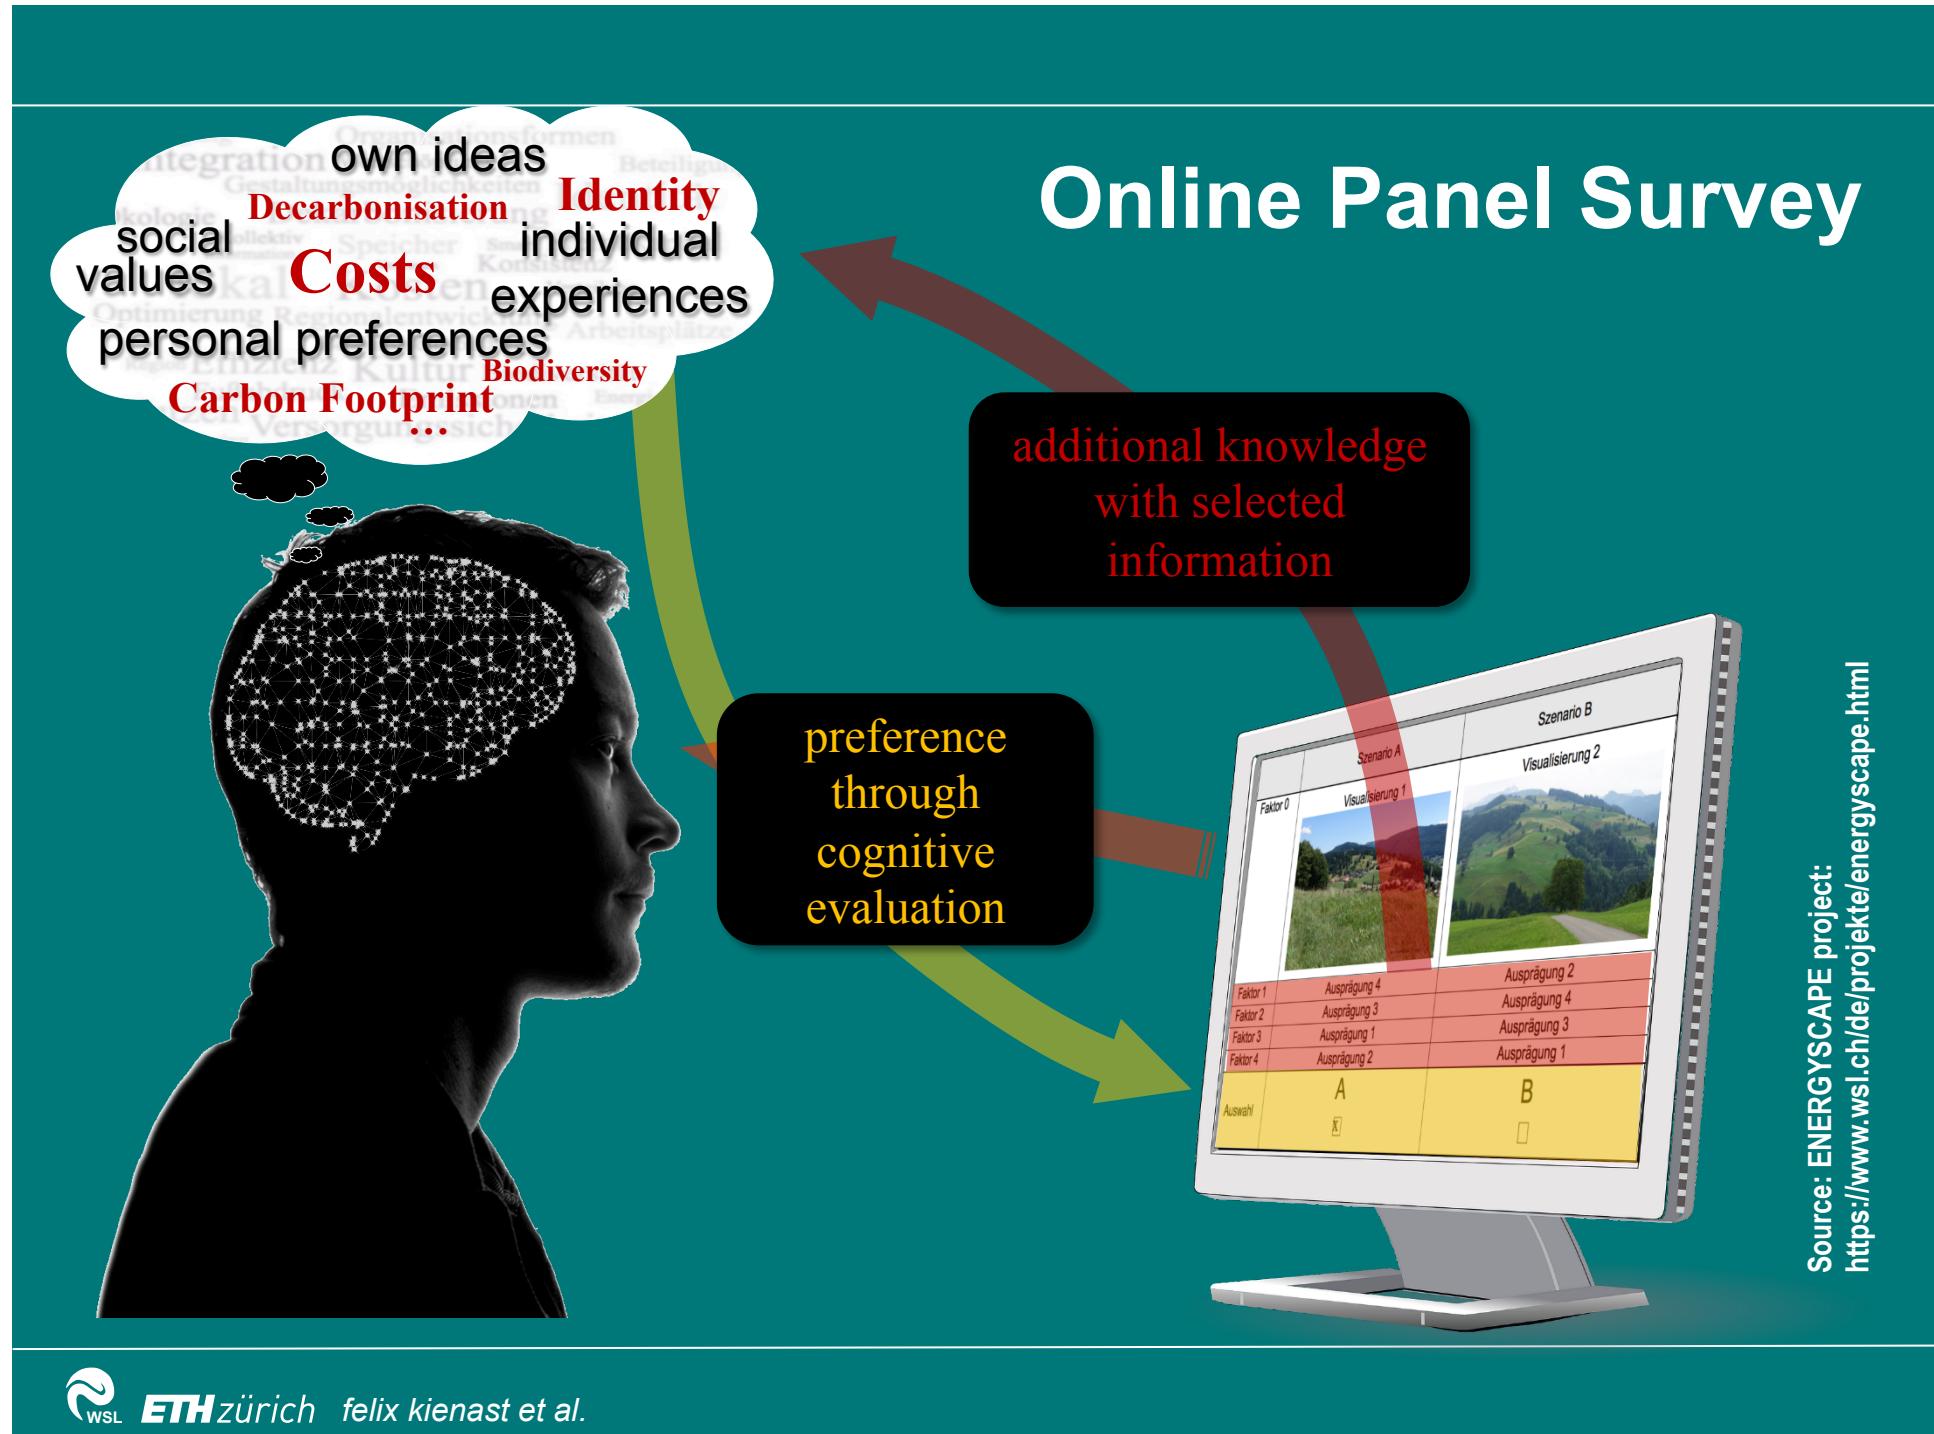

# Vistas for the preference study

Source: ENERGYSCAPE project:  
<https://www.wsl.ch/de/projekte/energyscape.html>

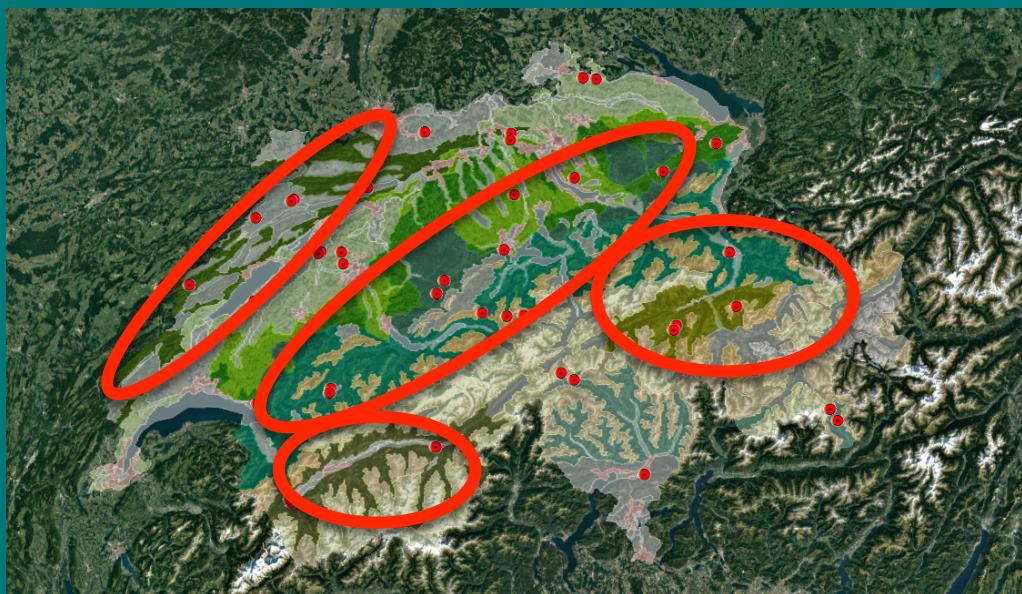

# Laboratory Experiment

Questionnaire  
Survey on the  
(explicit)  
cognitive  
response on  
landscape  
information

# Expected results in a nutshell:

Expected „energy horse“ areas

- Region-specific **meanings** of energy infrastructure
- Region-specific **acceptance** of energy infrastructure
- No Go areas

Source: ENERGYSCAPE project:  
<https://www.wsl.ch/de/projekte/energyscape.html>

# Take home message...

- ◆ Examples of both a top-down and a participatory planning exercise
- ◆ Reduce NIMBY problem (Devine-Wright, 2009)
- ◆ Evaluate the meanings of renewable energy in landscapes
- ◆ Improving the visual/contextual/meaning fit of renewable energy projects
- ◆ BUT: We are still awaiting evidence that the approach works in the real planning practice

# Thank you
