1. Summary/Preface

1. Summary/Preface

Today, worldwide more people are living in urban areas than in the countryside. Of this mega-trend urbanization that breeds both risks and opportunities, the emergence of the Megacity is perhaps the most visible expression. Aiming to analysing the complex urban processes, interactions and feedback mechanisms that turn megacities into a risk habitat, the international and interdisciplinary *Risk Habitat Megacity* research initiative was established. By investigating the processes and associated risks of mega-urbanization and developing implementation solutions for sustainable urban development in a comprehensive and interdisciplinary manner, new knowledge for orientation and application could be provided.

The *Risk Habitat Megacity* research initiative reflects the joint work of a network of about sixty natural and social scientists and engineers from more than ten Universities and research centres from Latin American countries, including the Economic Commission for Latin America and the Caribbean of the United Nations (ECLAC/CEPAL), and the Helmholtz Association in Germany. Five Helmholtz Centres participated: the German Aerospace Centre (DLR), the Karlsruhe Institute of Technology (KIT), the Helmholtz Centre for Infection Research (HZI), the GeoForschungsZentrum Potsdam (GFZ), and the Helmholtz Centre for Environmental Research (UFZ) where the initiative was coordinated. The funding by the Helmholtz Initiative and Networking Fund was a decisive complement of the involved Helmholtz Centres that likewise contributed by their own resources.

This final report of the research initiative aims at summarizing in brief the variety of results that evolved. This includes both, specific results within the various research topics as well as overall results developed by the entire initiative. It is the outcome of an innovative research design that includes an ‚integrative‘ approach, combining and integrating different thematic perspectives on one selected city region, Santiago de Chile, that led to conclusions of the complex system Megacity. While attempting to discover the state of and development in individual realms of Santiago de Chile, the initiative gained a more thorough understanding of the entire urban system and its constitutive elements. With its problem perspective and context-specific investigation, this approach links the generation of orientation knowledge with action-oriented knowledge and the implementation of solutions.

Given that the number and size of mega-large and mega-complex systems will continue to grow in the future, there is significant potential for further research in this direction. It is hoped that the approach and its intention of shifting governance in megacities “from response to action” and from “sectors to systems” will make a valuable contribution. Currently, the work of *Risk Habitat Megacity* continues with a re-focus on climate change adaptation.

With this final report, we would like to thank the Helmholtz Association for supporting the research initiative through its Initiative and Networking Fund.

2. Work and results report

- A) Starting point
- B) Progress of the work carried out
- C) Major results
- D) Special aspects of the project
- E) Future work
- F) Potential for application

2. Work and results report

A) Starting point

The international and interdisciplinary *Risk Habitat Megacity* research initiative was established aiming to analysing complex urban processes, interactions and feedback mechanisms that turn megacities into a risk habitat. The work of the initiative was driven by the fact that the year 2007 was marked by the ‘urban turn’ that finds for the first time in history more people living in urban areas than in the countryside, with the emergence of the Megacity as perhaps the most visible expression of the mega-trend urbanization. The Helmholtz research initiative therefore based the work on the following objectives that were explored for one selected case, the Metropolitan Region of Santiago de Chile:

- » **Assess characteristic risks** and their driving factors and interdependencies by combining and applying natural, applied and social scientific risk research approaches to the perspectives of hazardous events and vulnerabilities.
- » **Design strategies and instruments for risk management** as key tools for a more sustainable urban development.
- » **Develop scenarios for future urban developments** and a system of appropriate and locally adopted indicators for evaluating risks.
- » **Develop implementation solutions** that take institutional, political, economic and social backgrounds into consideration.
- » **Build a platform for continuous** interdisciplinary, cross-cultural **learning** and application to integrate academic research and practice.
- » Create a suitable environment for **young researchers**, where activities comprise training and education by the Chilean and German research partners.
- » **Transfer results and knowledge** into academic and professional practice.

According to these main objectives, the *Risk Habitat Megacity* research initiative developed an innovative comprehensive and interdisciplinary approach that combines basic theoretical and conceptual considerations with empirical and application-oriented analysis. By investigating the processes and associated risks of mega-urbanization and developing implementation solutions for sustainable urban development, it presents new knowledge for orientation and application.

The project was structured according to three Cross-Cutting Concepts (CCCs) and seven Fields of Application (FoA). The three CCCs *Sustainability*, *Risk* and *Governance* represented the integrative conceptual framework of the initiative. The sustainability concept formulates the target dimension (defining sustainability targets for the future development of Santiago de Chile), the risk concepts indicate the problem dimension (pointing at the severity of certain problems) and the governance concept concentrates on the action side (providing strategies and instruments for mitigating risks and adapting to risks). These CCCs have been analysed and evaluated according to the following seven megacity-typical empirical FoA: Land use management, Socio-spatial differentiation, Energy system, Transportation, Air quality and health, Water resources and services, and Waste management.

Three outstanding features characterized the overall structure and the work of the initiative:

1. An 'integrative' approach that combines and integrates different thematic perspectives on one selected city region, Santiago de Chile – this leads to conclusions of the complex system "Megacity"
2. A future orientation that builds on scenarios and indicators – this guides the development of sustainable development strategies for Santiago de Chile
3. The training and integration of 20 young researchers in an interdisciplinary and international context.

B) Progress of the work carried out

The research initiative carried out its work according to the following six main milestones:

1. Problem analysis
2. Risk analysis
3. Scenario analysis
4. Development of measures for mitigating and adapting to risks
5. Integration of measures in recommendations for a consistent sustainability strategy
6. Transferring results to other Latin American Megacities

» Ad 1: The **problem analysis** was finalized by all FoA. The results were presented at status conferences in June 2008 in Santiago de Chile and in September 2009 in Leipzig.

» Ad 2: Based on three different risk concepts on urban risks that were selected and further developed for the purpose of the initiative (hazardous risks; sustainability risks; systemic risks), all FoA finalized the **risk analysis**. The results were presented in May 2010 in Santiago and are in the focus of the Risk Habitat Megacity book that will be published in 2011 by Springer Publisher.

» Ad 3: The **scenario analysis** builds on the work with indicators – developed in intensive exchange with local stakeholders. Three alternative framework scenarios were developed for the year 2030 (Business as Usual; Market Individualism; Collective Responsibility). These framework scenarios were contextualized in all FoA, resulting in FoA specific storylines, and future perspectives. The results were presented at the stakeholder conference in October 2010. The scenarios and

the scenario process will be published in a scenario book.

» Ad 4 and 5: Based on the scenario results, **context-specific measures** and policy **recommendations for a consistent sustainability strategy** for Santiago de Chile were developed. A summary of results was published as a synthesis report in 2010 in English and Spanish. The report was distributed among local stakeholders and other Megacity researchers.

The Regional Government (GORE) has been intensively involved in the discussion on scenarios as they are currently developing a regional development strategy for Santiago for the year 2030. The main results of the research initiative have been handed over to them, to be included in their development strategy.

» Ad 6: **Results were transferred to other Latin American megacities** (Buenos Aires, Lima, Mexico, Sao Paulo, Bogotá). Several workshops were realized in Bogotá. A solid research network was established in Latin America. One of the results is a comparative Panorama on the sustainability of six Latin America megacities – published by CEPAL/ECLAC in 2011.

However, the efforts of transfer could not be transformed into 'real' research within all five megacities beyond Santiago as the second envisaged implementation phase of RHM (beginning in 2010) was not approved. This was the main modification to the original work plan.

Changes in the financial planning were necessary as the scenario process and the embedding of the Chilean PhD candidates took more time than expected. A financial prolongation was approved until February 2011. According to the time table, given the prolongation until February 2011, all milestones were accomplished.

The total number of PhD students financed by the initiative is 20. PhD students in Chile are still working on their thesis, while in Germany all PhD students are expected to get finished in the year 2011, the first four have already defended their thesis (see appendix).

No exceptional problems were encountered during the duration of the research initiative. Among the main challenges were intercultural and interdisciplinary differences between the partners (quite a “normal” problem in an international context) that had to be dissolved. Some difficulties arose from the changes in the Regional Government (GORE) that made the exchange with political stakeholders especially challenging. The severe Chilean 2010 earthquake was likewise reflected in the work of the initiative as some workshops could not be held as planned. Nevertheless, none of the mentioned difficulties endangered the successful accomplishment of the main objectives of the initiative (see also point c) in this report).

C) Major results

The *Risk Habitat Megacity* research initiative delivered a great variety of results on different levels: On the one hand, there are specific results within the various research topics (Fields of Applications as well as Cross-Cutting Concepts). On the other hand, overall results were developed by the entire initiative.

1. Selective results on the level of individual research topics:

In the different research topics, advances in empirical findings, methods, models, tools and measures could be achieved. The following results represent a selection of major outcomes:

- » A tour-based approach for modelling activity and travel pattern considering time-space constraints

in Santiago de Chile was developed in order to better understand existing individual travel behaviour. This new approach extends existing trip-based transport demand models and allows, based on the analysed exemplary tour, the application to further tour types to estimate the entire transport demand of Santiago city.

- » A reliable model of the S-wave velocity (the velocity of secondary waves that typically follow the primary waves during an earthquake) for the basin of Santiago de Chile was derived that indicates the influence of local geologic conditions modifying the ground motion when earthquakes occur well outside of the Santiago basin. Furthermore, seismic hazard scenarios were calculated.
- » Changes in runoff were modelled based on land-use developments, urban planning laws, climate change predictions, and expert interviews and allow for predictions about the changes in flood hazard which the adjacent urban areas are facing after heavy winter precipitation events.
- » To gain a perspective on the future development of the energy system, an existing energy system model was adapted for the case of Chile. The integration in the future scenario analysis allowed for conclusions on sustainability-related risks of Chile's energy system.
- » Model calculations were performed to estimate the amount of landfill gas emitted and to assess the impact of waste composition and the capturing and flaring of the gas on landfill gas emission.
- » The main drivers of socio-spatial differentiation processes were analysed and hot-spots identified that bear the potential of social exclusion. A household questionnaire survey and expert interviews were undertaken for analysing the potential of social integration in socially mixed areas.

2. Overall results on the level of the entire initiative:

The topic-related results represent essential products that have been integrated and synthesized at the overall level of the initiative. The most important outcomes for the implementation phase in Santiago de Chile regarding risks and sustainable development can be summarized as follows:

Risk analysis and risk management proposal

Regarding the risk analysis and risk management proposals, three separate risk concepts were developed and applied for the different FoA, following the idea that a multiple perspective is a more adequate approach to risk in complex situations than a single perspective. This likewise considers that a single risk concept would fail to satisfy the analysis requirements for the broad range of risks concerned in megacities. This multiple risk approach refers to hazardous, sustainability and systemic risks. It extends the current knowledge of complex risks in megacities and creates added value to risk discourses. Furthermore, it deepens the understanding of the emergence of risks and their severity and opens up a new perspective for researchers and stakeholders embedded in “traditional thinking”. All results and conclusions will be available in the book “Risk Habitat Megacity” that will be published in 2011.

Sustainability analysis, sustainability deficits and recommendations

The sustainability analysis of Santiago de Chile was conducted based on the operationalizing of the Helmholtz Associations' Integrative Sustainability Concept that serves as a framework of sustainability goals and rules. The concept builds essentially on the use of indicators and scenarios. A global explorative framework scenario was defined based on a set of driving factors. Based on this, three alternative scenarios were formulated, each describing a different possible path for the development in Santiago de Chile until the year 2030 (Business as Usual; Market Individualism; Collective Responsibility). The development of indicators, driving factors and storylines included intensive discussion with experts and stakeholders in Santiago de Chile.

The contextualization of indicators and scenarios in all FoA was the basis for the analysis of topic-specific current sustainability deficits as well as future development paths that lead in a final step to concrete policy recommendations. The framework, the overall analytical approach of indicators and scenarios and its context-specific application represent an innovative tool that helps to deal with uncertainties and complexities, to sensitize for behavioural change,

to create participatory processes and to support decision-making. The main results were summarized in a Spanish and English synthesis report that has been published as an UFZ report in 2010. This report was distributed among stakeholders in Santiago de Chile and researcher from other Megacity programmes.

3. Highlights:

There is a great number of further outcomes that are listed below. For publication details and the education of young researchers, see Appendix.

» **New knowledge.**

According to the interdisciplinary character of the initiative, interdisciplinary knowledge was exchanged and applied. This holds especially true for joint publications and the education of young researchers.

» **Chilean-German exchange.**

The overall success of the initiative was guaranteed through continuous Chilean-German coordination meeting, and continuous exchange between the German and Chilean counterparts. Three annual status conferences were organised with all project partners. Two of them took place in Santiago de Chile (2008 and 2010). The 2009 status conference was organised in Leipzig. Each of the status conference included a PhD specific activity like poster session or individual PhD workshops.

» **PhD education.**

The status conferences were accompanied by PhD summer/winter schools (Los Andes, Naumburg, Santiago de Chile) whereof two were mainly organised by the PhD themselves.

» **Regional Implementation.**

Transdisciplinarity was assured by strong collaboration with the Regional Government (GORE) in Santiago and intensive exchange with local experts both scientists and practitioners in the different topics. In this context several workshops on different levels were organized.

» **German Platform on Megacity Research.**

Intensive exchange with other scientists, politicians, etc. as well as representativeness of the research initiative could be achieved by participating in several Innovation forum (BMBF), giving joint presentations with other Megacity research initiatives (BMBF + DFG) at conferences (e.g. World Urban Forum), and throughout a good reputation of individual topics and the overall initiative at international conferences in general.

» **International Programmes.**

An excellent research network in Chile and Latin America could be established and visibility within the broader scientific community (UGEC (Urbanization and Global Environmental Change) project of the International Human Dimension Program -IHDP, World Bank, Siemens, etc.) and among politicians could be achieved. This was underlined by the co-organisation of the Forum Bogotá - Berlin - Beijing - Desafíos y Soluciones para las Megaciudades, as an integrated scientific event of the ExpoDeutschland 2008 in Bogotá (Columbia).

» **International Conference.**

The research initiative organized the international conference ‘Megacities: Risk, Vulnerability and Sustainable Development’ with more than 200 participants in 2009 in Leipzig. This conference offered a platform for exchange within the worldwide Megacity research community. The conference included more than 100 presentations, three key note speeches, a poster session and a young researchers’ workshop.

» **Regional Platform Latin America.**

Among the results is a regional Panorama, a comparative study on Sustainability in six Latin American Megacities under the auspices of the United Nations Economic Commission for Latin America and the Caribbean.

» **Web-based meta data system.**

Through the elaboration and establishment of a meta data system, exchange of data between all participating partners of the initiative could be guaranteed and facilitated.

» **Trilingual glossary.**

A web-application with Megacity-specific terms related to Risk, Governance and Sustainability was elaborated and implemented. This is a very useful tool to strengthen the common understanding across geographical and disciplinary boundaries.

» **Videos.**

For visualization and learning, a series of videos were developed explaining the overall problems of Santiago de Chile and tackling the FoA-specific risks and opportunities. Both German and Latin American involved scientists stated their proper points of view.

» **Atlas.**

The development of an urban geo-science Spanish-English web-based Atlas is still under consideration. This Atlas will make the main results in terms of maps available for the public.

» **UN Decade.**

Furthermore, the research initiative was awarded as an official project of the UN decade ‘Education for sustainable development’ 2009/2010.

» **German minister Shavan** visiting RHM project.

In 2009 the initiative was visited in Santiago de Chile by the German minister of education (Mrs. Schavan).

D) Special aspects of the project

1. Features decisive for funding

Among the main features that were decisive for funding was

- a) The general increasing interest in mega-urbanization given the fact that more than half of the world population is living in cities and the amount of megacities is increasing. In this context, Latin America as one of the most urbanized continents represents an especially interesting case study.
- b) The good and long lasting contacts with researchers and organisations in Santiago de Chile that facilitated the establishment of a Chilean-German research consortium.
- c) The innovative integrative and interdisciplinary research approach. The focus lied on investigating a wide range of complex and overlapping processes as well as multiple risks in one Megacity, Santiago de Chile. The research approach comprises the combination of conceptual, theory-based knowledge with empirical findings, predictions in the future (scenarios) as well as the exchange with local stakeholders.
- d) The strong integration of in total 20 German and Latin American PhD students. Thereby contributing to capacity building in an interdisciplinary, intercultural and international research environment.

2. Added value

The funding by the Helmholtz Initiative and Networking Fund was a decisive complement of the involved Helmholtz Centres that likewise contributed by their own resources. The additional funds were especially valuable for the support of the 20 PhD students as well as travel costs that allowed intensive contact with the

Chilean partners. The funds therefore fostered the exchange between disciplines, cultures, science and policy and helped to develop an intensive network in Latin America. Without that additional funding, the project would not have succeeded.

3. Strategic benefit

Among the strategic benefits is the ‘Positioning’ and ‘Visibility’ of the Helmholtz Association within the Megacity research community in general and in Latin America in particular. Together with the two other German Megacity research initiatives of the DFG and the BMBF, a German Initiative of Megacity research was established through continuous exchange and joint representation. In general, the *Risk Habitat Megacity* research initiative serves as an outstanding example of strategic partnerships and its ‘Architektenrolle’ in international projects and co-operations.

E) Future work

The partners of the *Risk Habitat Megacity* research initiative recognized the potential for continuing topic-specific work as well as integrative work of high importance. The transfer of the conceptual framework, results and knowledge to other Latin Americas megacities would have been a beneficial and logical continuation of the initiative. But as no additional funding was available, this could not be followed up.

Fortunately, Megacity research can be followed up within the ClimateAdaptationSantiago (CAS) project. This project is financed by the International Climate Initiative of the Federal Ministry for the Environment, Nature Conservation and Nuclear Safety (BMU). The work of Risk Habitat Megacity continues with a re-focus on climate change adaptation.

The main objective of the CAS project is the development of adaptation measures for the Metropolitan Region of Santiago de Chile. The work includes a strong participatory process and the establishment of a Regional Learning Network on climate change adaptation in Latin American large agglomerations. Partners in this project are two Helmholtz Centres, the Karlsruhe Institute of Technology (KIT) and the Helmholtz Centre for Environmental Research (UFZ), coordinating the project. Among the Chilean partner institutions are the Pontificia Universidad Católica de Chile, the University de Chile and the United Nations Economic Commission for Latin America and the Caribbean.

F) Potential for application

The results of the *Risk Habitat Megacity* research initiative in form of policy recommendations have been handed over to the regional and local stakeholders who will hopefully include them in development strategies. The project does not address business – therefore licences, patents and co-operation with business was not envisaged. <<

3. Annex Products 2007- 011

- A) Qualification of junior researchers**
 - PhD theses
 - Habilitation thesis
 - Diploma/Bachelor/Master theses
- B) Publications**
 - Published contributions
 - Unpublished working papers
- C) Public lectures, presentations**
- D) Award**
- E) Press releases**

2. Annex - Products 2007 - 2011

A) Qualification of junior researchers

PhD theses

Azócar de la Cruz, Gabriela
Universidad Alberto Hurtado
“Coordination as a mechanism of risk observation”

Clerc, Jacques
Universidad de Chile
“Applied general equilibrium and sustainability indicators for Santiago”

Durán Saavedra, Gustavo A.
Pontificia Universidad Católica de Chile
“Power morphology in the capitalist city. Urban poverty, governance and water market in Santiago de Chile”

Godoy Barbieri, Cristián Hernán
Universidad de Chile
“Simulation model for riverine systems: local morphologic changes and water management (Tentative)”

González Martínez, Tahnee
Karlsruhe Institute of Technology (KIT)
“Analysis of different municipal waste management concepts for the megacity Santiago de Chile and their impacts on the informal sector” (thesis defended)

Höhnke, Carolin
Helmholtz Centre for Environmental Research – UFZ
“Public transport governance in the light of decentralization – the cases of Santiago de Chile and Bogotá”

Justen, Andreas
German Aerospace Center
“Model based evaluation of transport policies in megacities – the case Santiago de Chile” (thesis defended)

López Ospina, Héctor Andrés

Universidad de Chile

“A model of the urban dynamic system: predicting the emerging urban sustainability from agents behavior and system constraints using a multi-scales approach”

Lukas, Michael

Helmholtz Centre for Environmental Research – UFZ

“Political participation in the context of periurban megaprojects in Santiago de Chile”

Müller, Annemarie

Helmholtz Centre for Environmental Research – UFZ

“The influence of land use and land cover changes on the flood risk in Santiago de Chile” (thesis defended)

Muñoz, José

Universidad de Chile

“Multiscale traffic model”

Paredes Martinez, Gonzalo

Universidad de Chile

“Modelling energy systems in megacities with a focus on sustainable development”

Perez, Adriana

Universidad de Chile

“Seismic hazard in the central Chilean region”

Pilz, Marco
GFZ German Research Centre for Geosciences
“Site effect characterization by means of seismic noise and earthquake analysis in large urban areas of Santiago de Chile” (thesis defended)
